# HIV in the United Kingdom: *Focus on the undiagnosed*

Dr Valerie Delpech  
HIV and AIDS reporting section  
National Infection Service  
Public Health England

# Conclusions

- The Clinical outcomes of people living with HIV accessing their care through the National Health Service (NHS) are excellent and improving.
- In 2014 the population as a whole and subgroups of people living with HIV in the UK has reached the UNAIDS targets of
  - 90% diagnosed on ART and
  - 90% virally suppression for those on ART
- Some minor differences by demographics and exposure groups exist however, with a need to increase undetectability among young people.
- Clinical care indicators improved over the past 5 years. This is due to
  - Earlier prescribing and uptake of ART as per British HIV Association guidelines and
  - An 'artificial' improvement due to an 'open cohort' effect
- People unaware of their infection remains high and we need to beware of an artificial % drop as more people are diagnosed with HIV.

## Continuum of HIV care: United Kingdom, 2014

\* Viral load (VL) < 200 copies/ml

† Number diagnosed estimated from MPES

## People living with HIV infection in the United Kingdom

- In 2014, an estimated **103,700** (95%CrI 97,500-112,700) people were living with HIV (PLWH)
- **18,100 (12,100 – 26,900)** or 17% (95% CrI 12-26%) were unaware of their infection.
- A total of **6151** people were newly diagnosed during 2014, of which 40% were diagnosed late with a CD4<350 cells/mm<sup>3</sup> at HIV diagnosis
- **85,489** people were living with diagnosed HIV and had accessed care (57,347 men and 28,142 women), and almost half were aged 45 and over (48%, 40,834).
- Treatment success in the UK remains excellent with 91% (76,462) of people diagnosed with HIV on ART, and 95% of all people on ART are virally suppressed (VL<200 particles/mL).

# Key findings: HIV in the United Kingdom, 2014

## **Gay, bisexual and other men who have sex with men (MSM)**

- In 2014, an estimated 45,000 MSM (95%CrI 41,900-49,500) were living with HIV in the UK, of which 14% (95%CrI 8-21%) were unaware of their infection.
- New diagnoses among MSM have continued to rise, and now account for more than half of new HIV diagnoses, with 3,360 newly diagnosed in 2014, 29% of which were diagnosed late.
- In 2014, 38,432 MSM were seen for care, accounting for 45% of all people accessing care and 67% of all men.
- PHE's MSM Action Plan 2015-16 highlights the importance of considering sexual health as an area of health that influences and is influenced by other areas, including mental health, alcohol and drug use. One of its objectives is to decrease the proportion of MSM reporting use of harmful illicit substances, including reduction in 'chemsex' or steroid abuse.

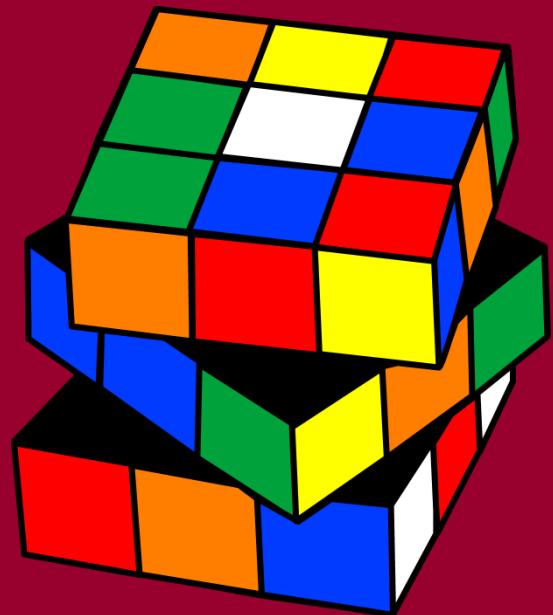

# Key findings: HIV in the United Kingdom, 2014

## Heterosexual men and women

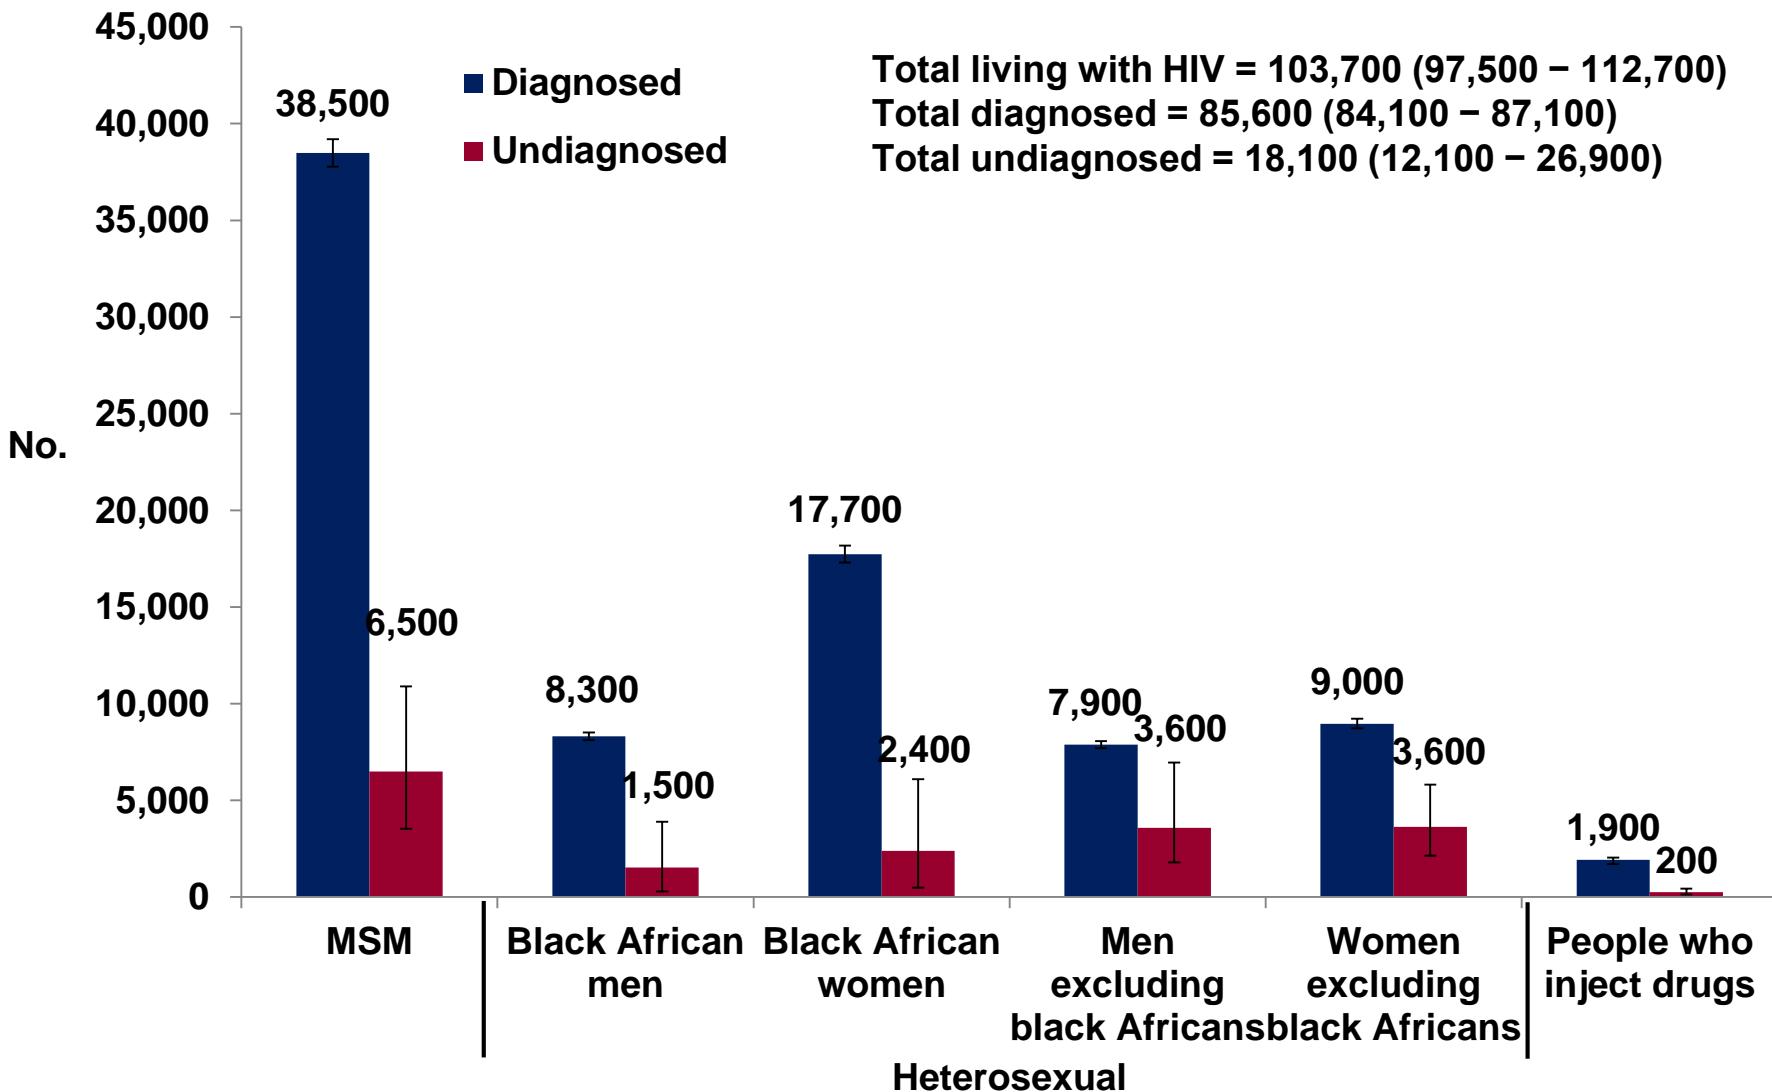

- In total, almost half (48%, 40,842) of all people accessing HIV care acquired their infection through heterosexual sex (15,383 men and 25,459 women).
- New diagnoses acquired through heterosexual sex has declined over the same time period (3,440 to 2,490), largely due to a reduction in diagnoses among black African men and women (1,801 in 2010 to 1,044 in 2014).
- Among heterosexuals, 60% of people were of black African ethnicity, 24% white, and 4% black Caribbean.
- In 2014, 24% of all heterosexual men (5,100, CrI 2,800-8,900) living with HIV were unaware of their HIV infection compared to 18% of heterosexual women.

Public Health  
England

# Prevalence of diagnosed HIV infection by area of residence among population aged 15-59: United Kingdom, 2014

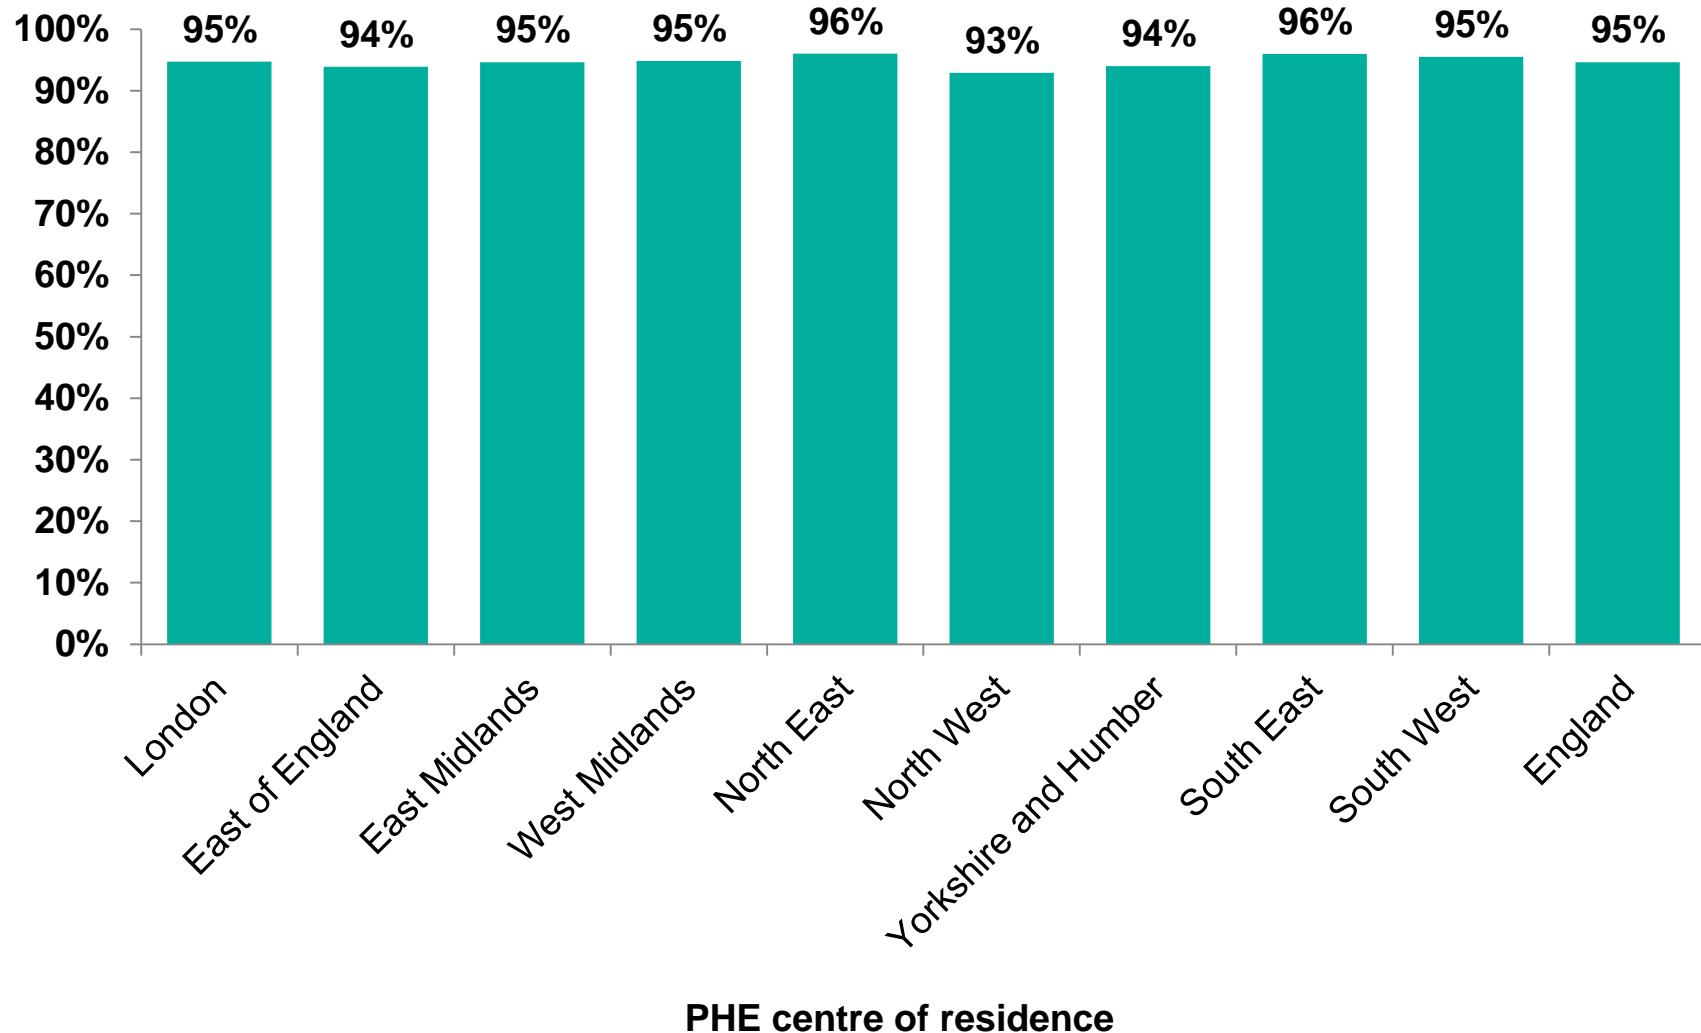

## Continuum of HIV care United Kingdom, 2011 vs 2014

Undetectable VL: VL<200 copies/ml

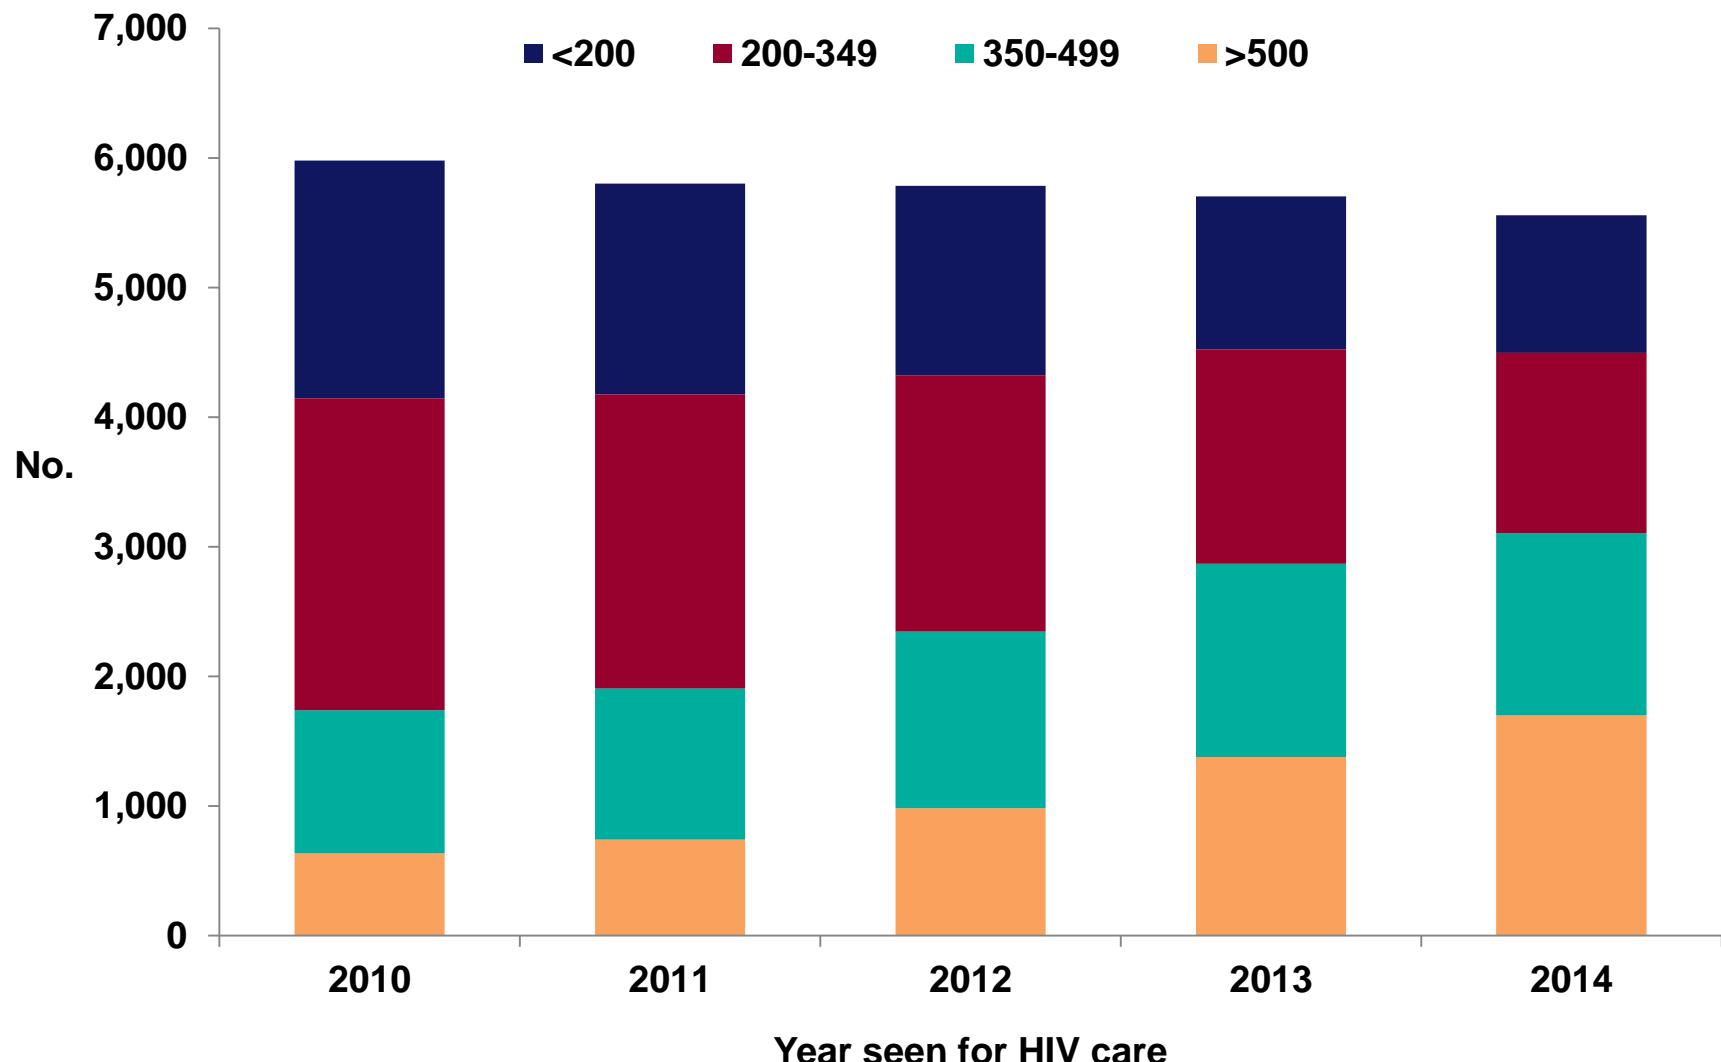

## Proportion of people on antiretroviral therapy with a viral load <200 particles/mL: England, 2014

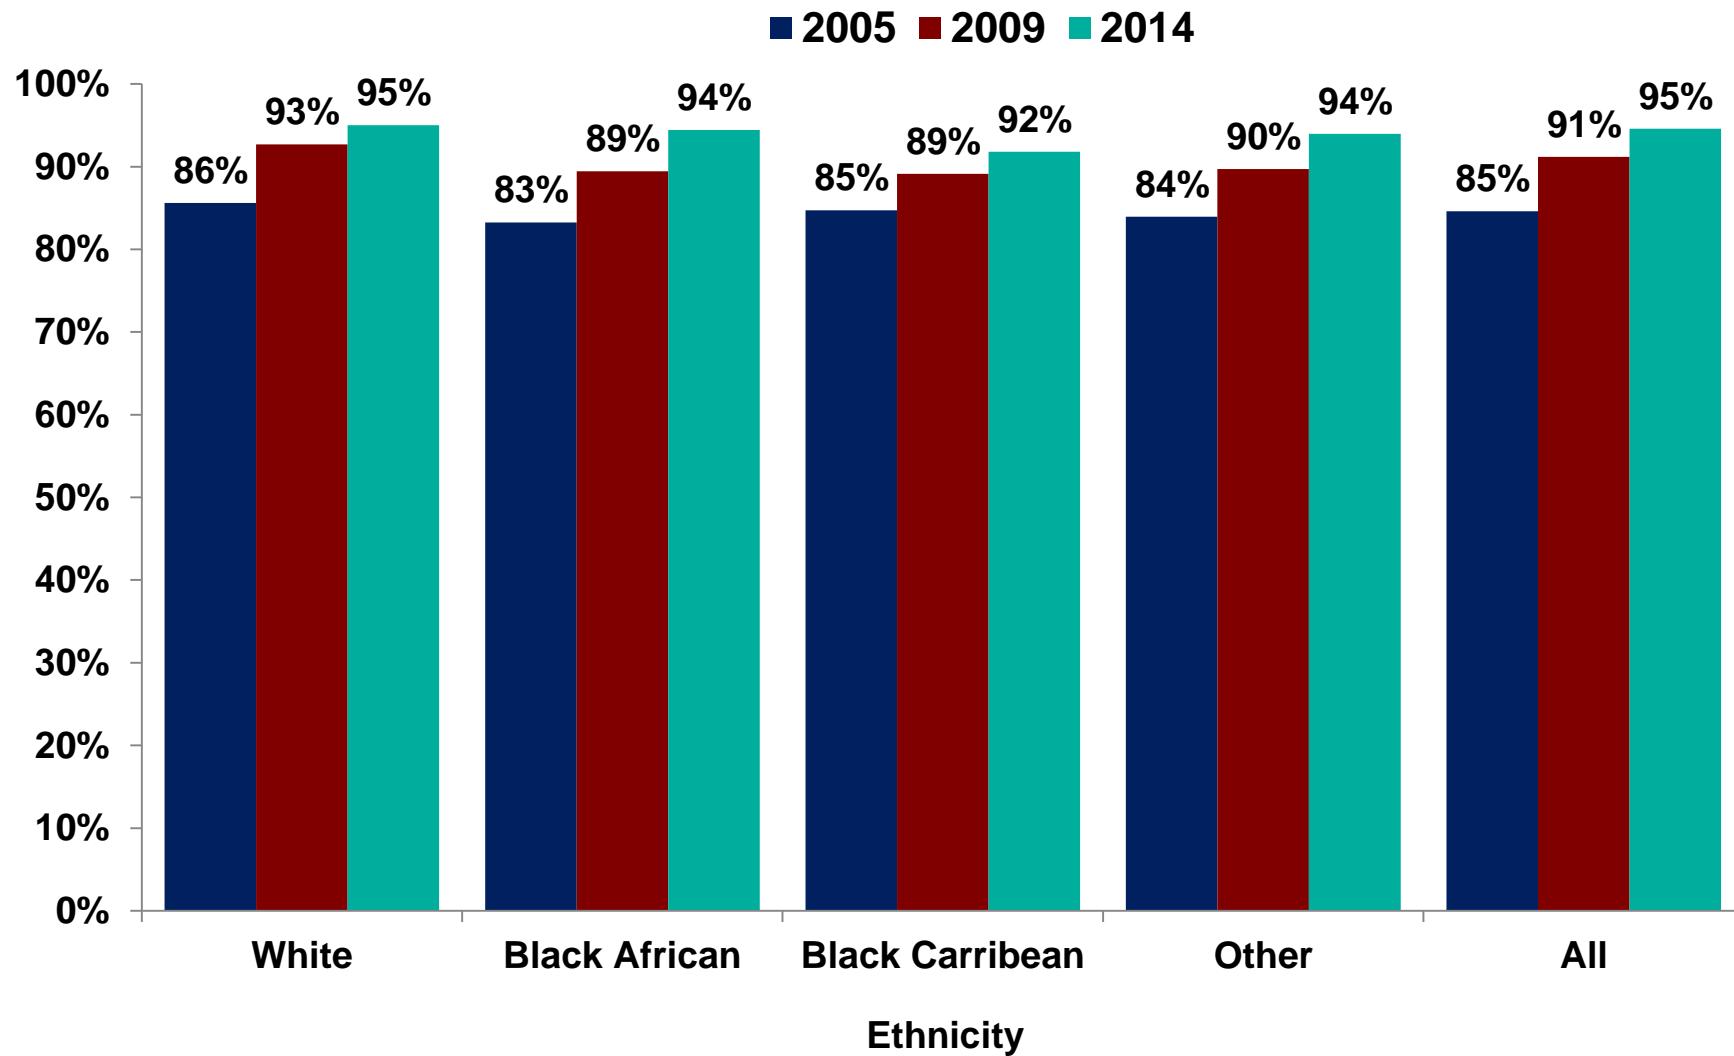

## Number of people starting ART by CD4 count at initiation: United Kingdom, 2005–2014

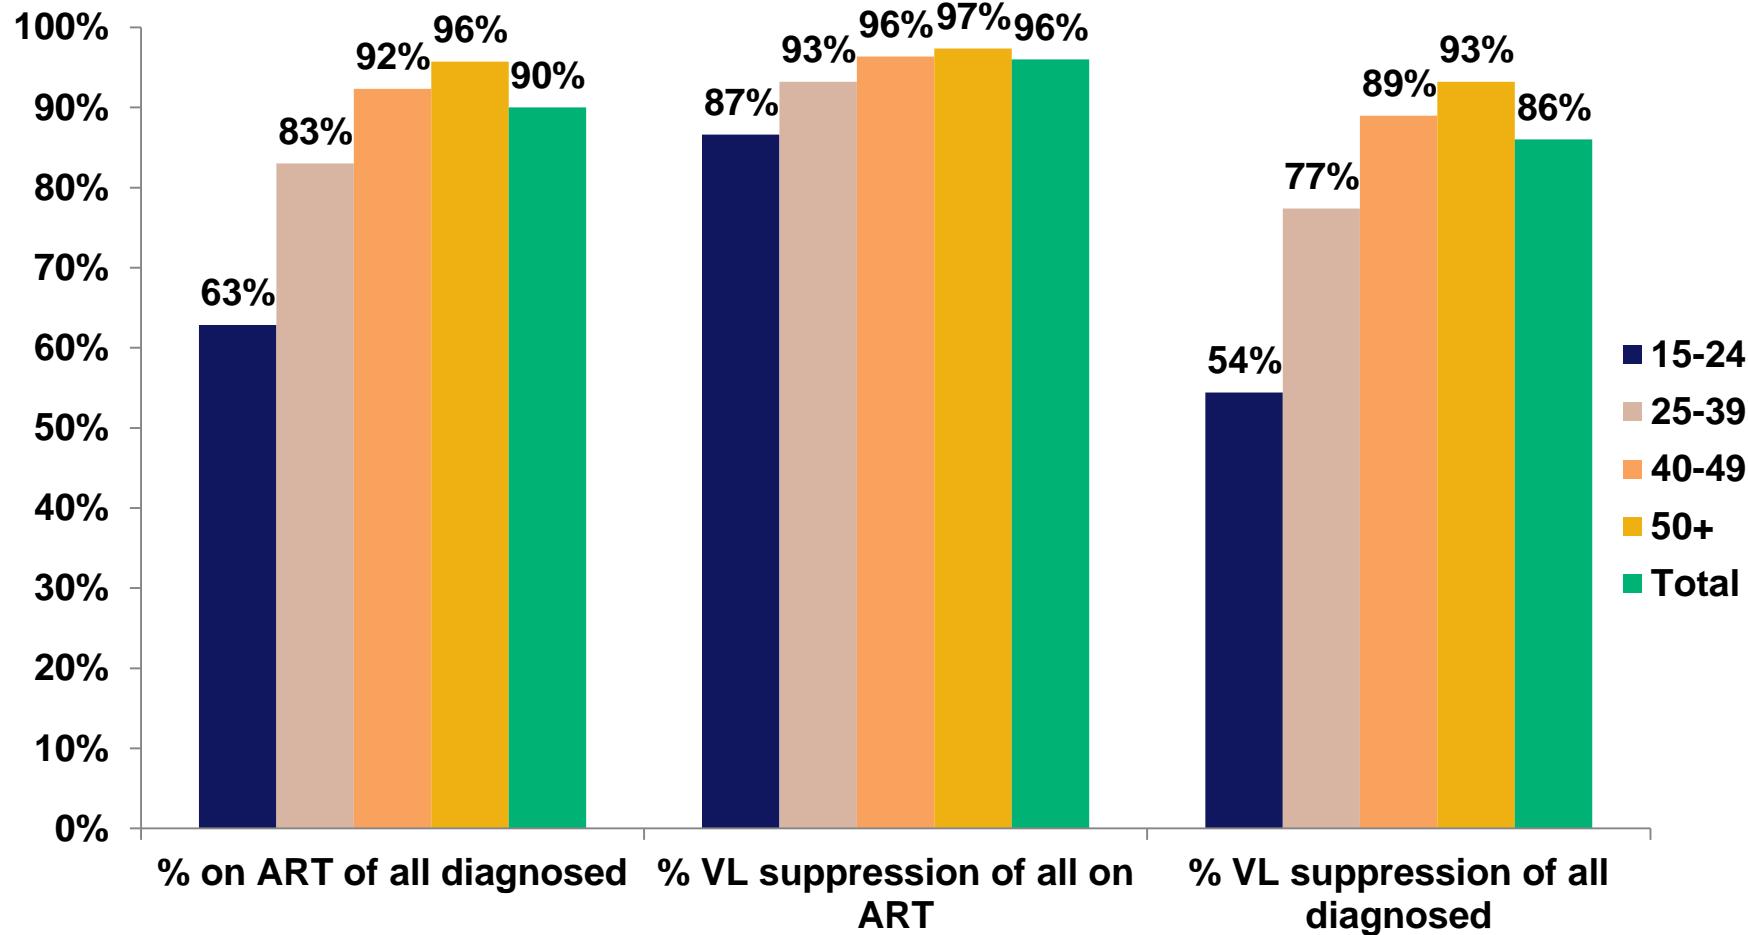

## Proportion of persons on antiretroviral therapy with a viral load <200 particles/mL by ethnicity: United Kingdom, 2005–2014

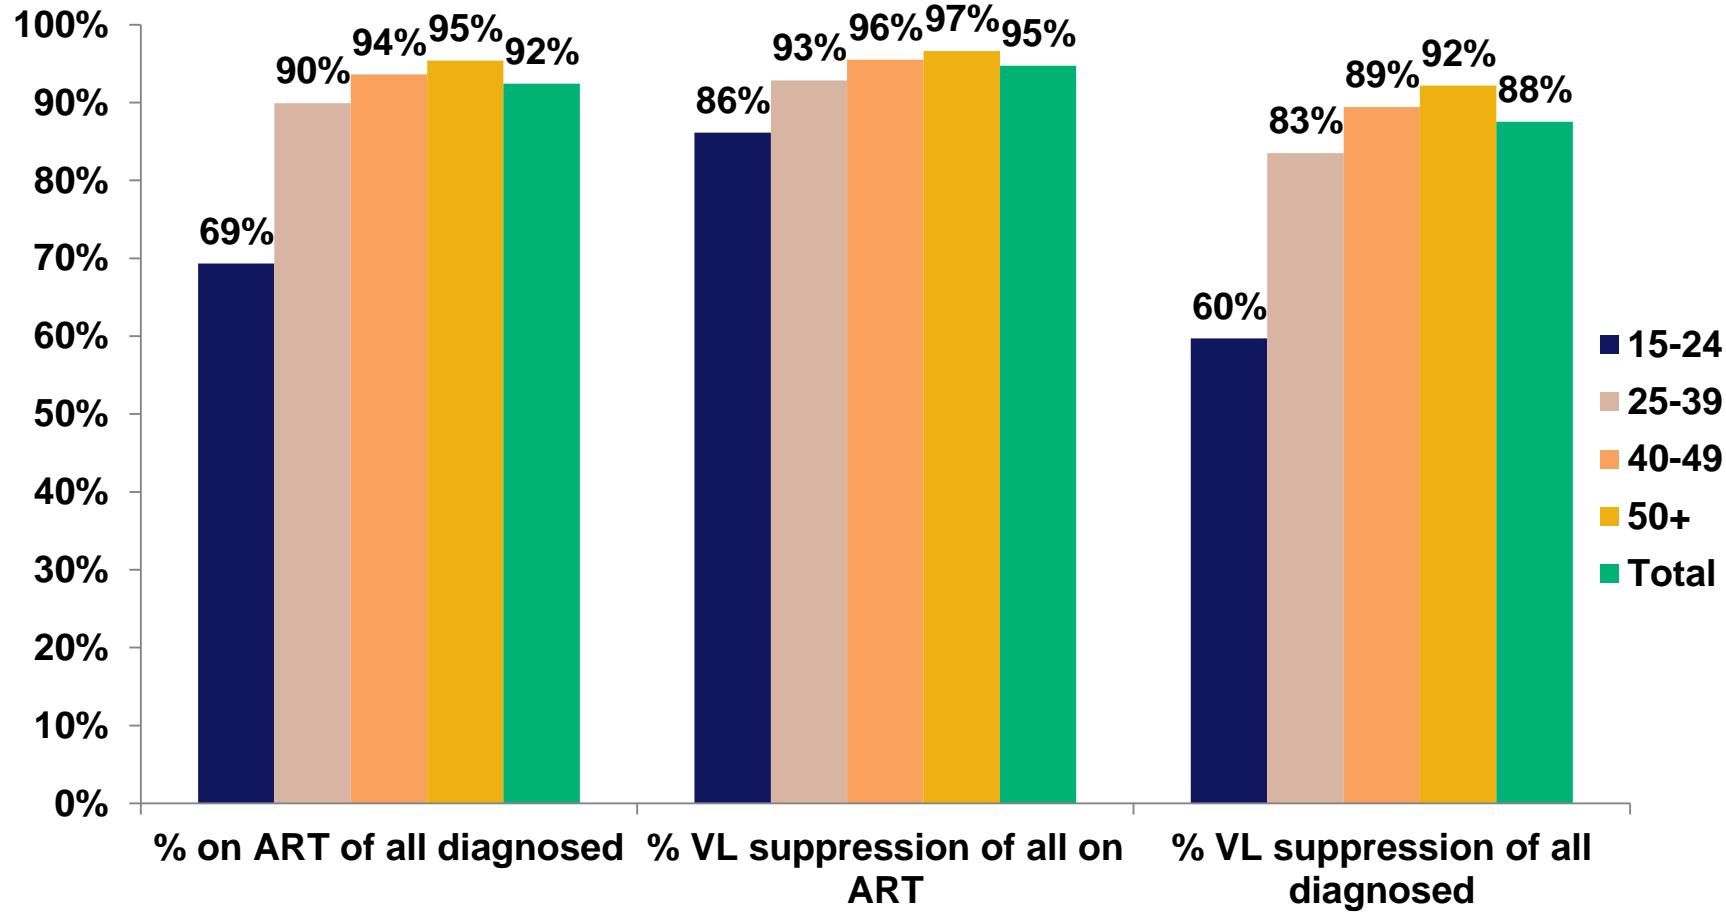

## ART coverage and VL suppression among MSM by age group: United Kingdom 2014

VL suppression: having the most recent VL undetectable ( VL<200 copies/ml)

## ART coverage and VL suppression among heterosexual Black African women by age group: United Kingdom 2014

VL suppression: having the most recent VL undetectable ( VL<200 copies/ml)

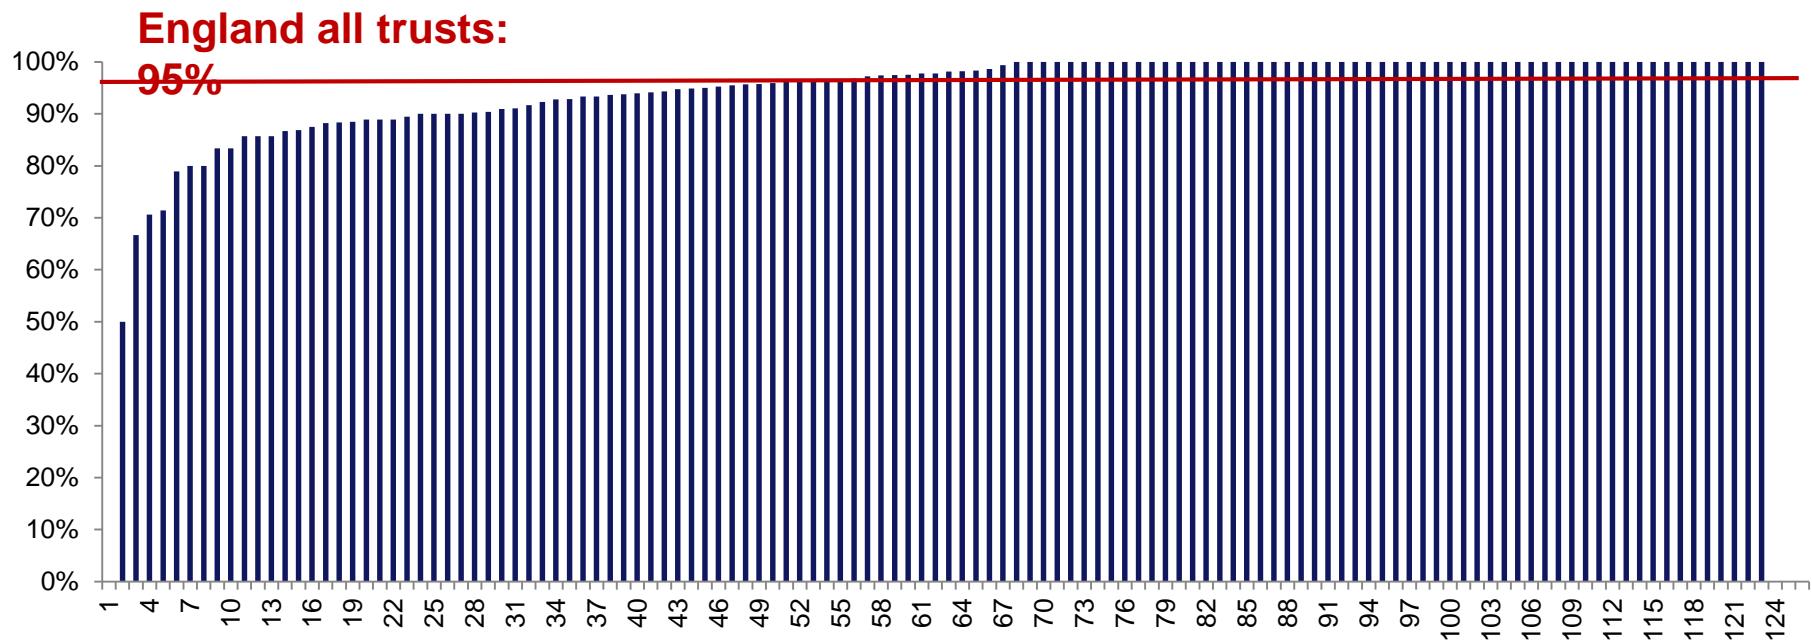

## HIV Clinical Dashboard indicators (England results)

Indicator	Specification	2011	2013
Late diagnosis	To monitor timeliness of diagnosis <i>CD4 cell count &lt;350 cells/mm<sup>3</sup> within 3 months of diagnosis</i>	47%	40%
Link to care	To monitor prompt integration into care following HIV diagnosis: <i>CD4 cell count taken within 1 month of diagnosis</i>	88%	93%
Retention in care - new patients	To monitor the retention in care among newly-diagnosed adults: <i>New diagnoses seen for care in the next survey year</i>	86%	89%
Retention in care - all patients	To monitor the retention in care among adults seen for care in the last 12 months <i>Adults seen for HIV care and also seen in the net survey year</i>	96%	95%
Viral load suppression	To monitor the effectiveness of ART after initiating treatment <i>Viral load &lt;200 copies/ml at 12 months of starting ART (window period 3 – 15 months)</i>	92%	95%
CD4 response	To monitor immune status of adults regardless of treatment status <i>CD4 cell count ≥350 cells/mm<sup>3</sup> after at least 12 months in HIV care</i>	83%	86%

## VL suppression (<200) among adults on ART >1 year 2013 results

- 123 trusts in England provided treatment to ART starters
- 95% of these starters had a VL <200 in 12 months of ART initiation
- 38% (47/123) trusts had a proportion below the England benchmark

# New HIV and AIDS Reporting System

## Advantages:

- Quarterly submission
- Attendance based data
- Online validation process
- Epidemiological fields
- Detailed clinical information
  - ✓ Attendance date
  - ✓ ART information
  - ✓ Complexity items

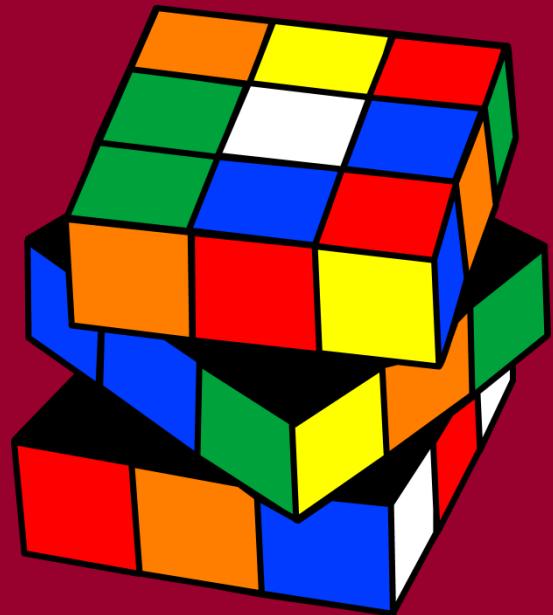

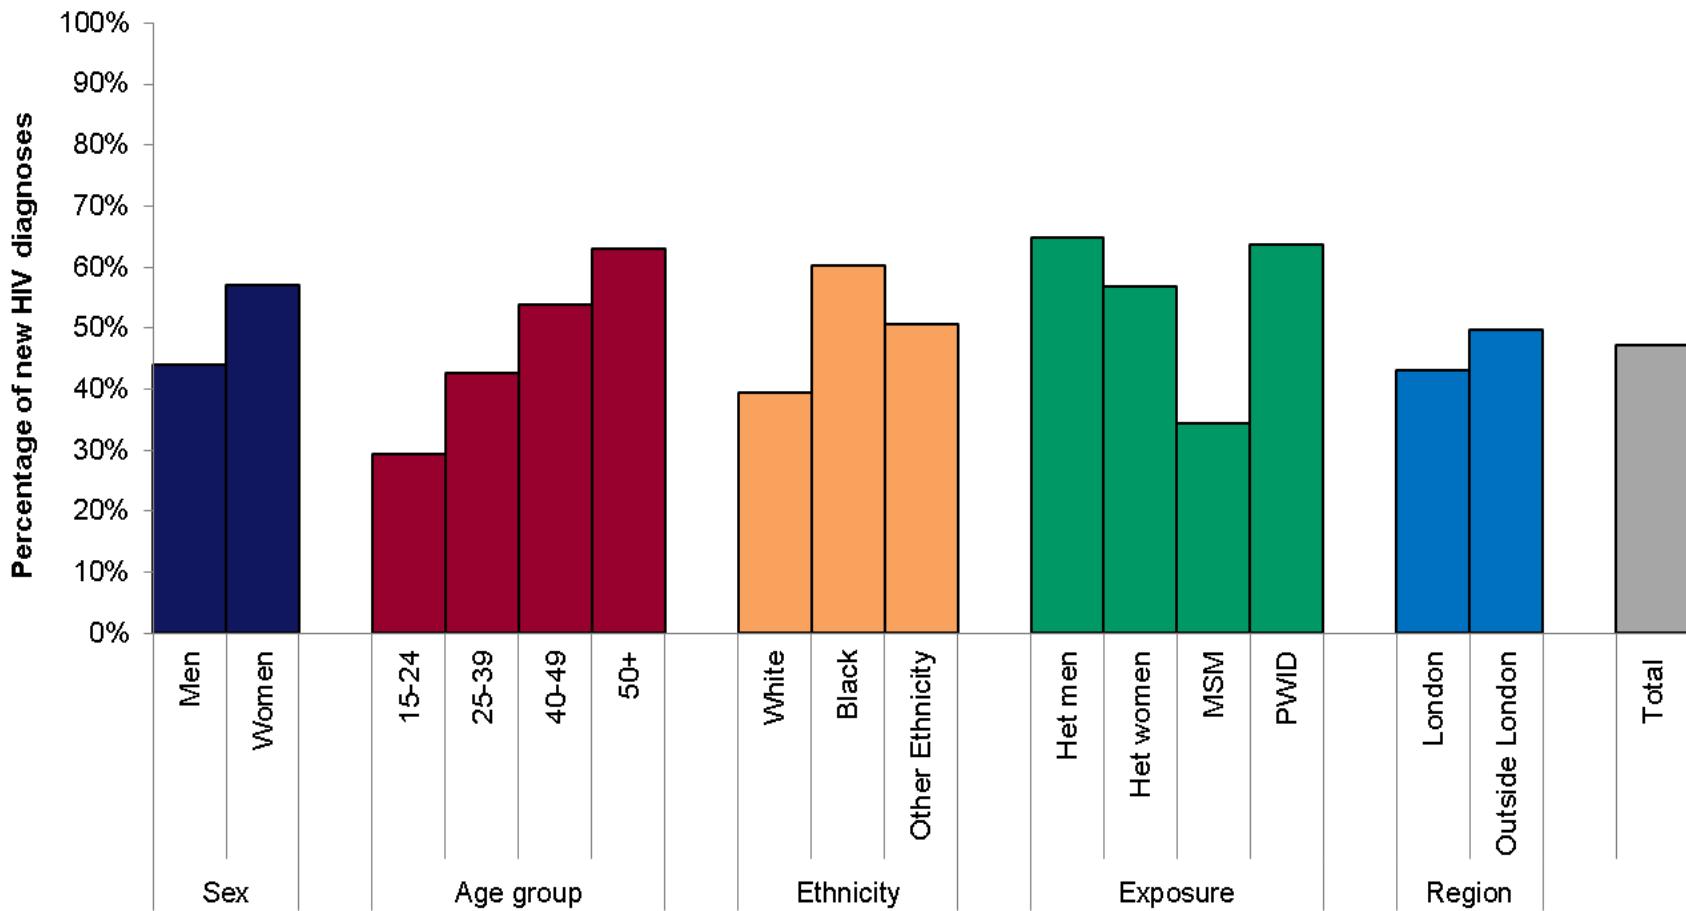

# Dashboard indicators 2016/2017

Indicator	Description & Provenance	2015/6	2016/7
<b>Late diagnosis</b>	Proportion of newly diagnosed adults a CD4 count of <350	Yes	Yes
<b>Very late diagnosis</b>	<b>Proportion of newly diagnosed adults a CD4 count of &lt;200</b>	No	Yes
<b>Linkage to care</b>	Proportion of newly diagnosed adults seen for care in 1 month	Yes	Yes
<b>Virological success in people established on ART</b>	<b>Proportion of adults who had an undetectable viral load at least one year after starting therapy</b>	Yes	<b>Revised!</b>
<b>Virological success in people newly starting ART</b>	<b>Proportion of adults who had a undetectable viral load within one year after starting therapy</b>	No	<b>New!</b>
<b>Retention in care -newly diagnosed</b>	Proportion of newly diagnosed adults retained in care in the following year of diagnosis	Yes	Yes
<b>Retention in care - all patients</b>	Proportion of all adults retained in care in the following year	Yes	Yes
<b>Patients with CD4 count &gt;350</b>	Proportion of HIV diagnosed adults with the last CD4<350	Yes	Drop
<b>ART coverage – all adults in care</b>	Proportion of HIV diagnosed adults seen for HIV care and receiving ART	No	<b>New!</b>
<b>ART coverage – patients with the last CD4&lt;350</b>	Proportion of patients with the last CD4 count<350 and receiving ART	No	<b>New!</b>

# *New and Late diagnosis*

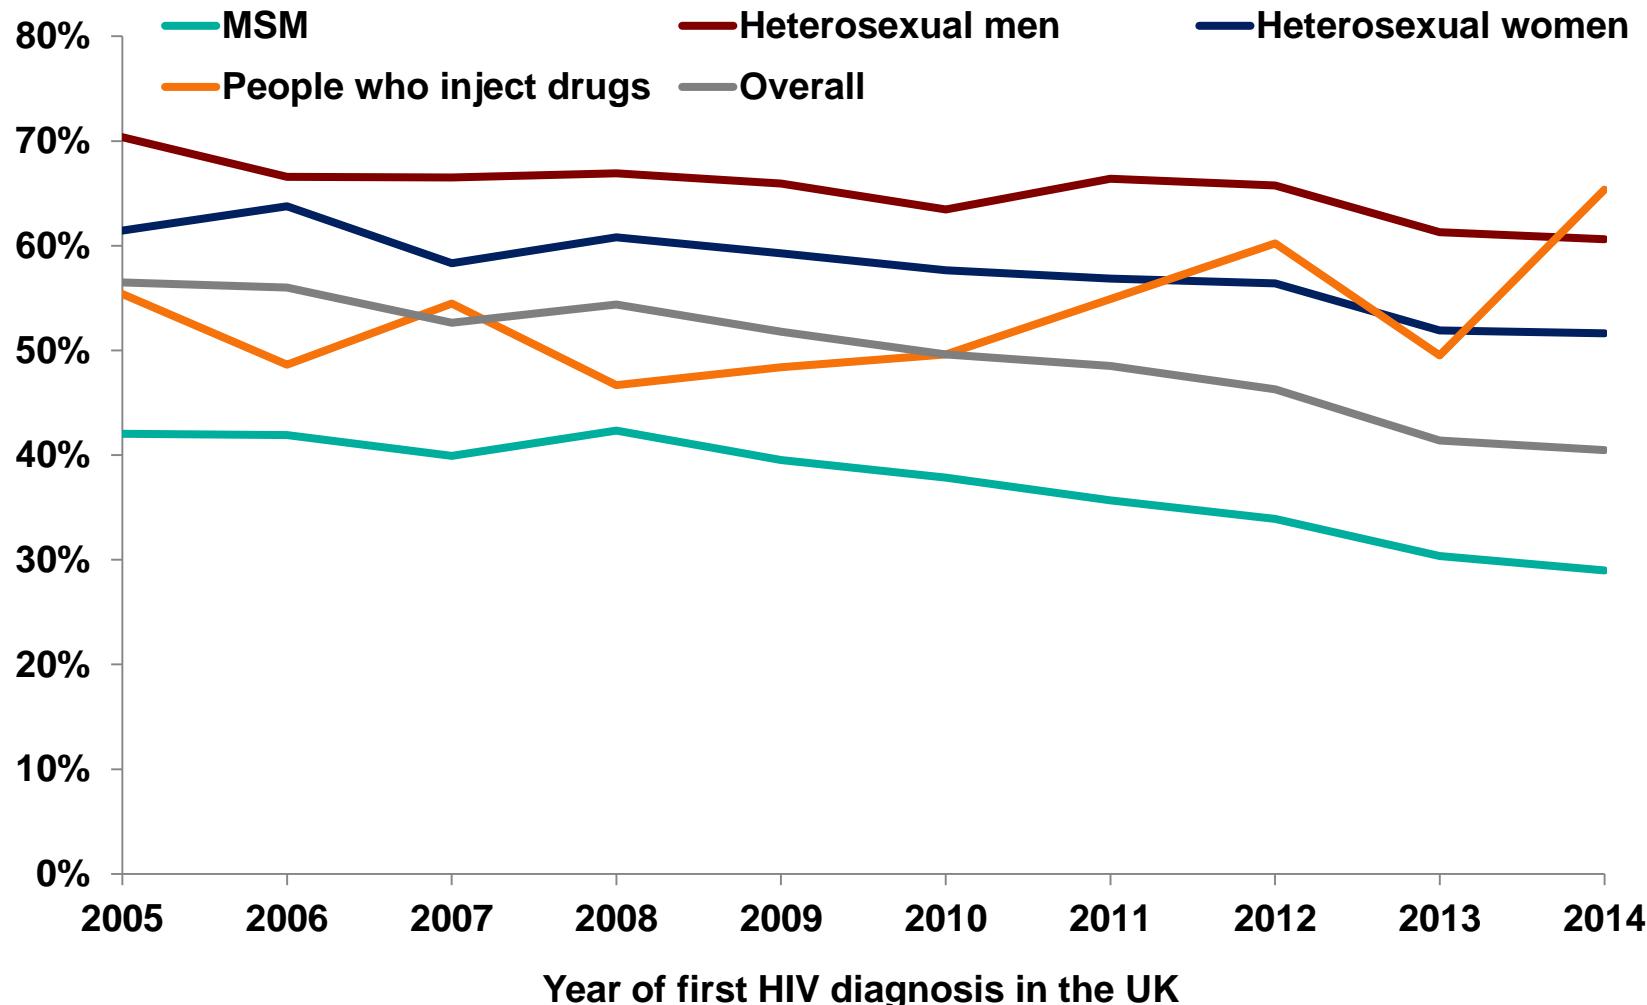

# Late HIV diagnosis: Proportion\* of adults diagnosed with a CD4 count <350 cells ,UK, 2014

\* CD4 <350 cells/mm<sup>3</sup> within three months of diagnosis

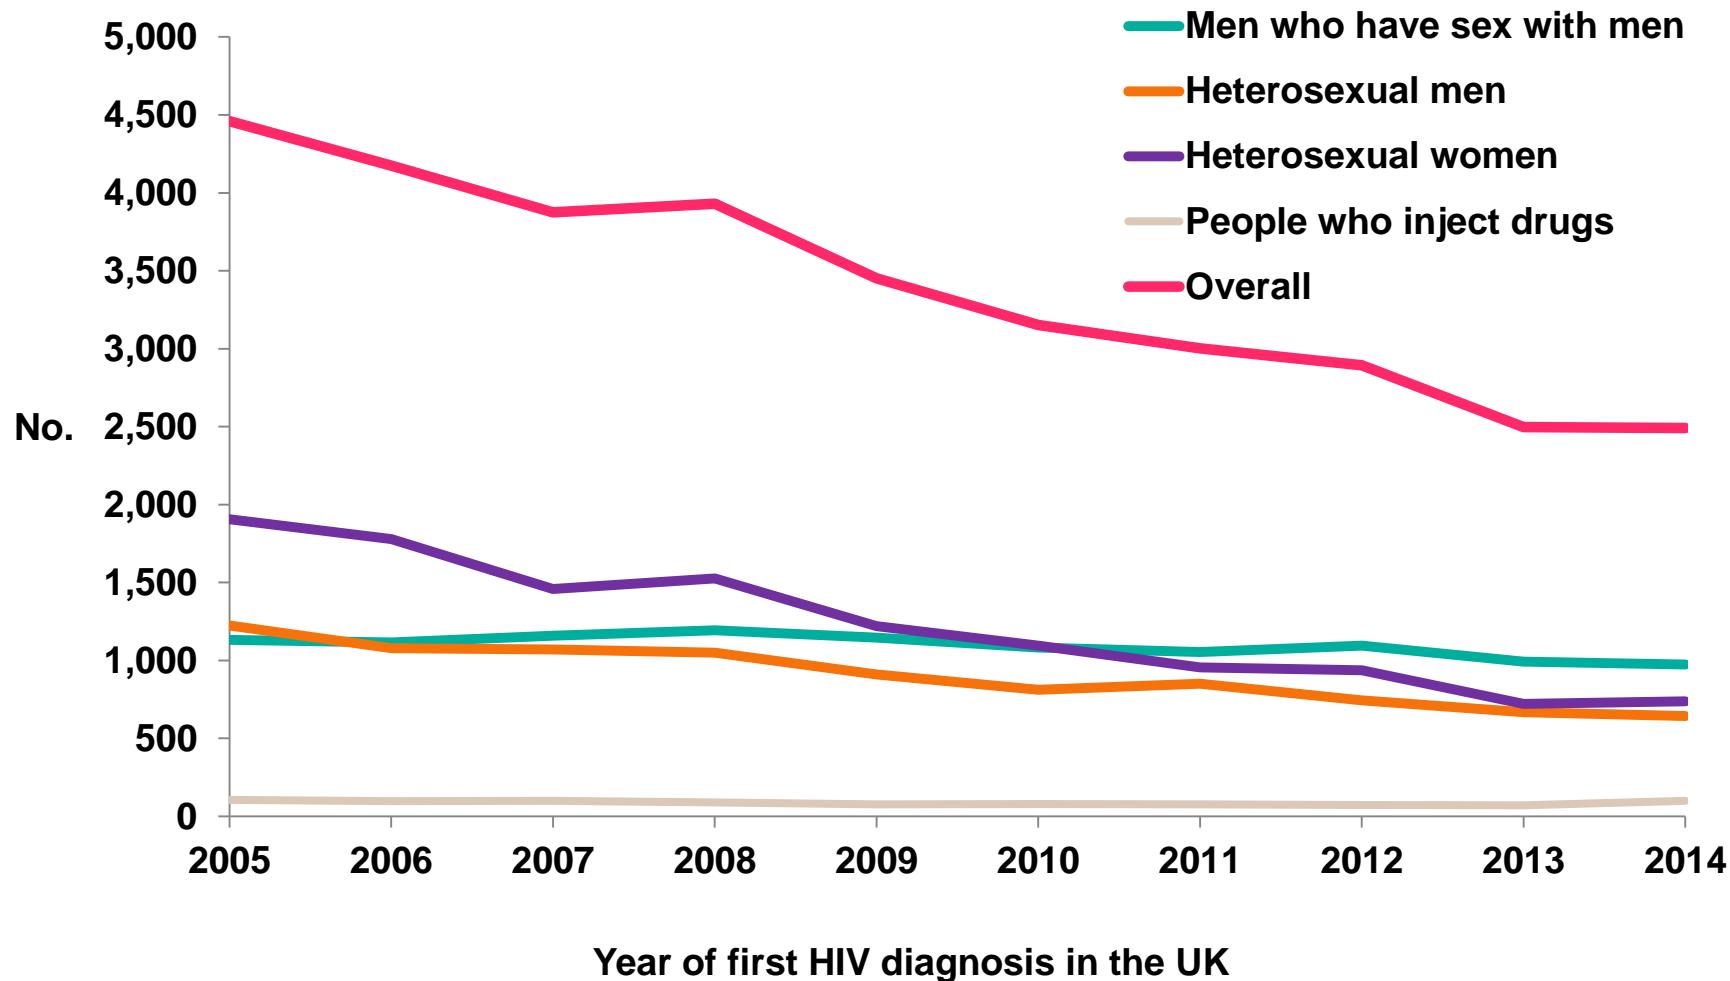

# Proportion of people diagnosed with HIV at a late stage of infection by exposure category: United Kingdom, 2005-2014

Numbers have been adjusted for missing CD4 cell count at HIV diagnosis.  
CD4 <350 cells/mm<sup>3</sup> within three months of diagnosis.

## Number of people diagnosed with HIV at a late stage of infection by exposure category: United Kingdom, 2005-2014

Year of first HIV diagnosis in the UK

Numbers have been adjusted for missing CD4 cell count at HIV diagnosis.

CD4 <350 cells/mm<sup>3</sup> within three months of diagnosis.

Public Health  
England

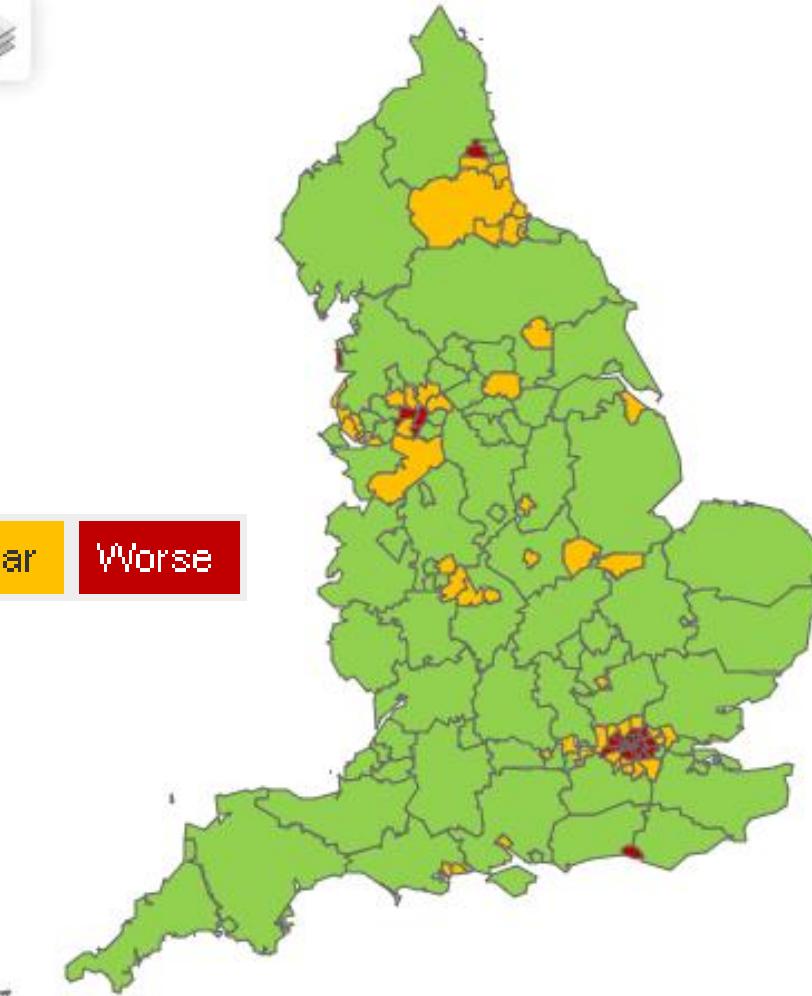

# Late HIV diagnosis (CD4<350 at diagnosis) by local authority of residence

Public Health Outcome  
Framework indicator  
(PHOF)

England: 42%

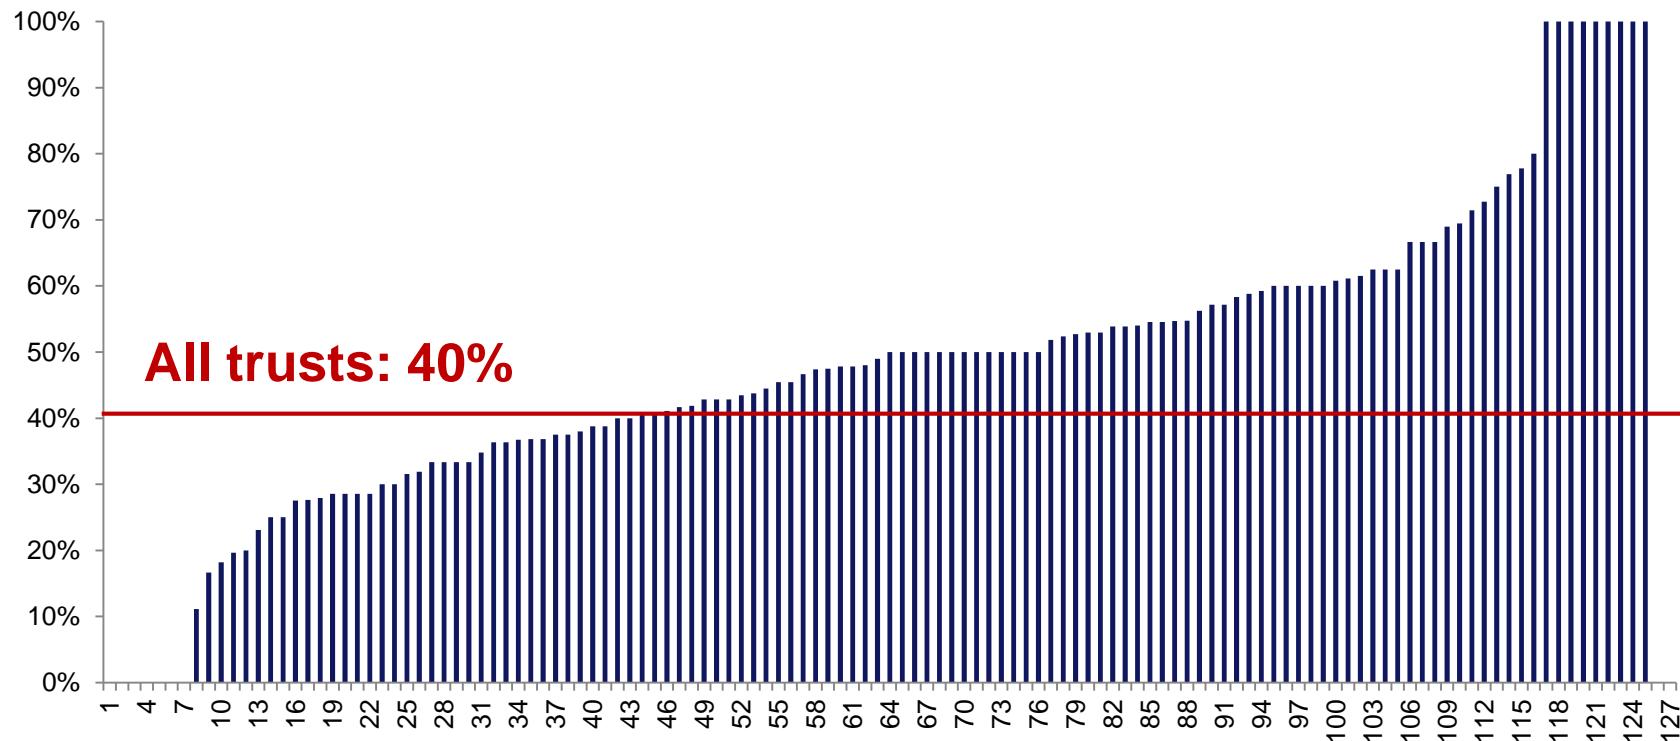

*Compared with benchmark:*

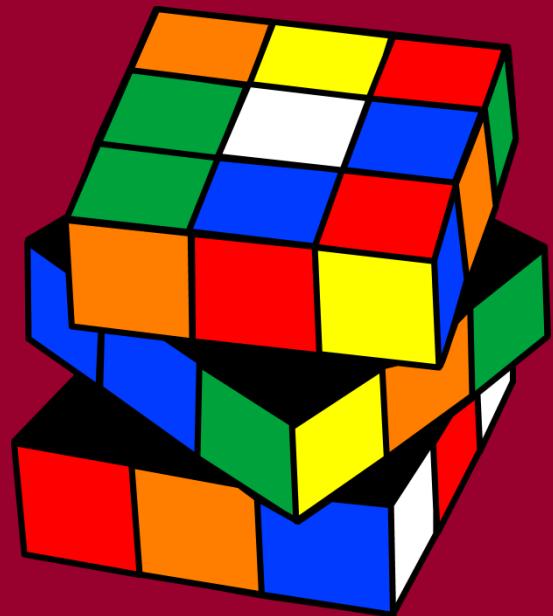

## Late HIV diagnosis (CD4<350 at diagnosis) by HIV service provider in 2014

- 127 trusts in England received newly-diagnosed adults in 2014
- 40% of these adults had a CD4<350 at diagnosis
- 34% (43/127) trusts were below the England benchmark

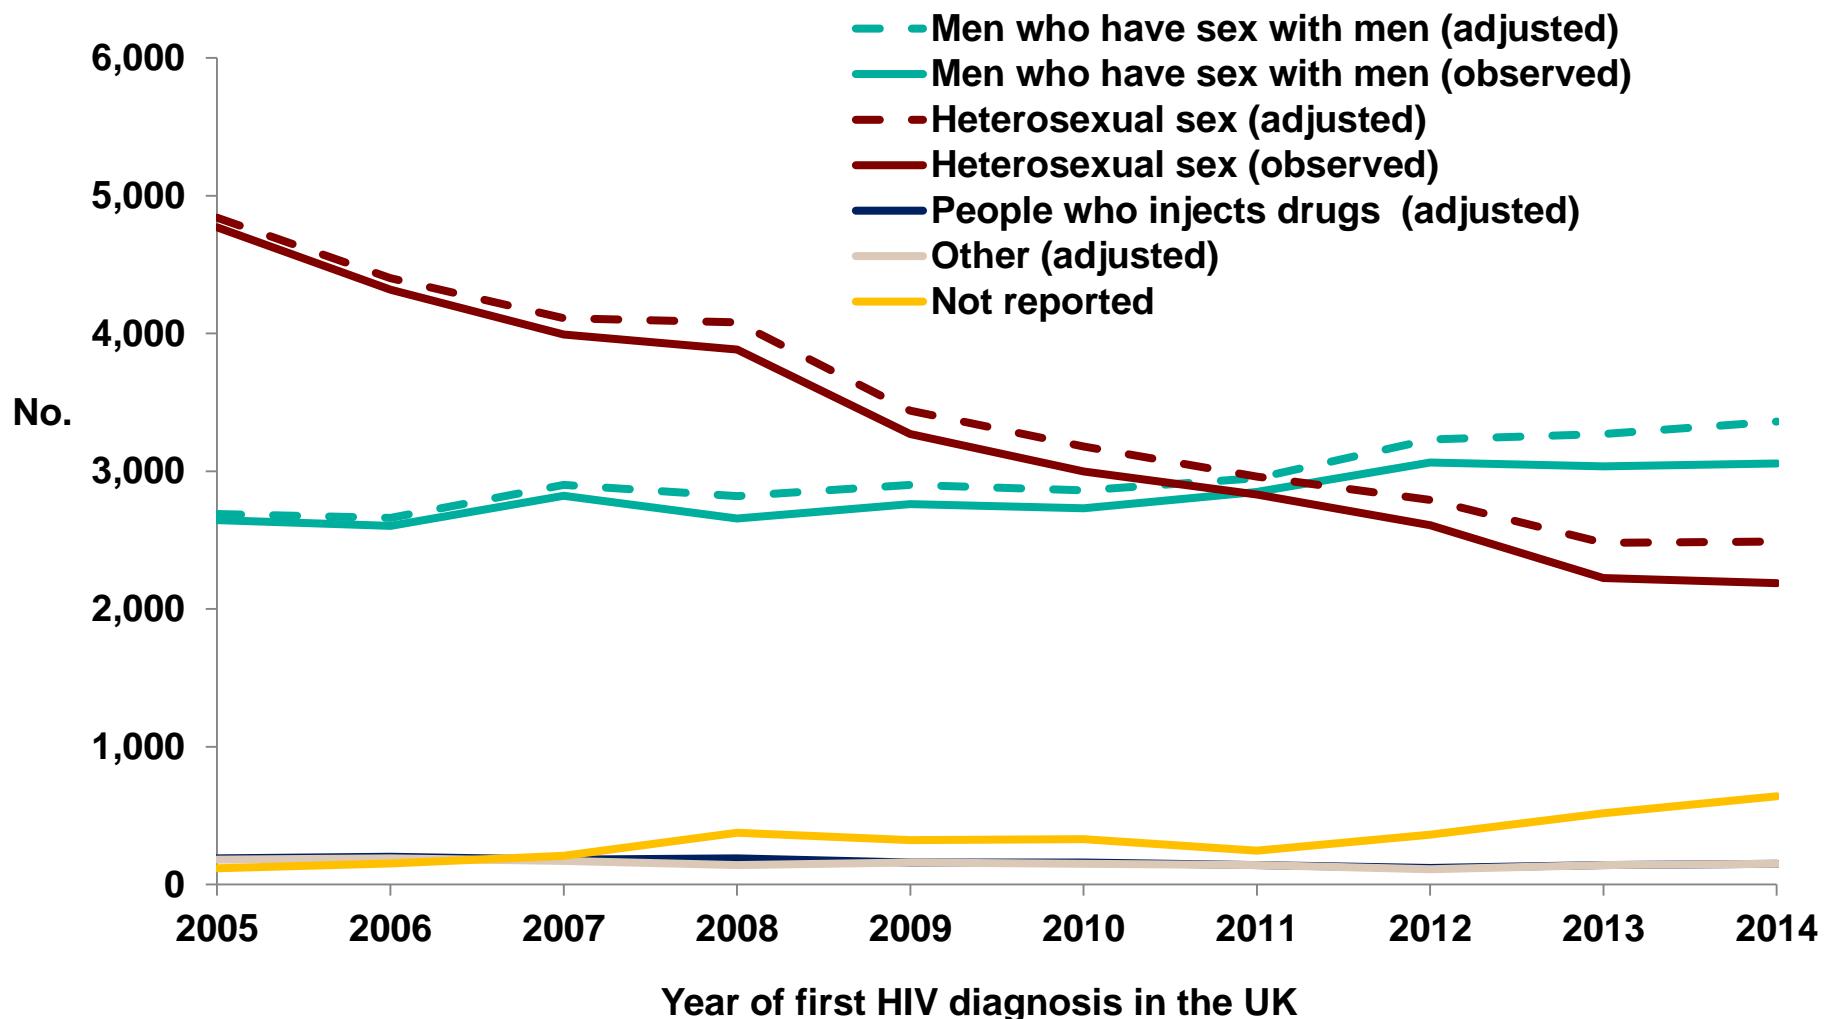

# New diagnoses

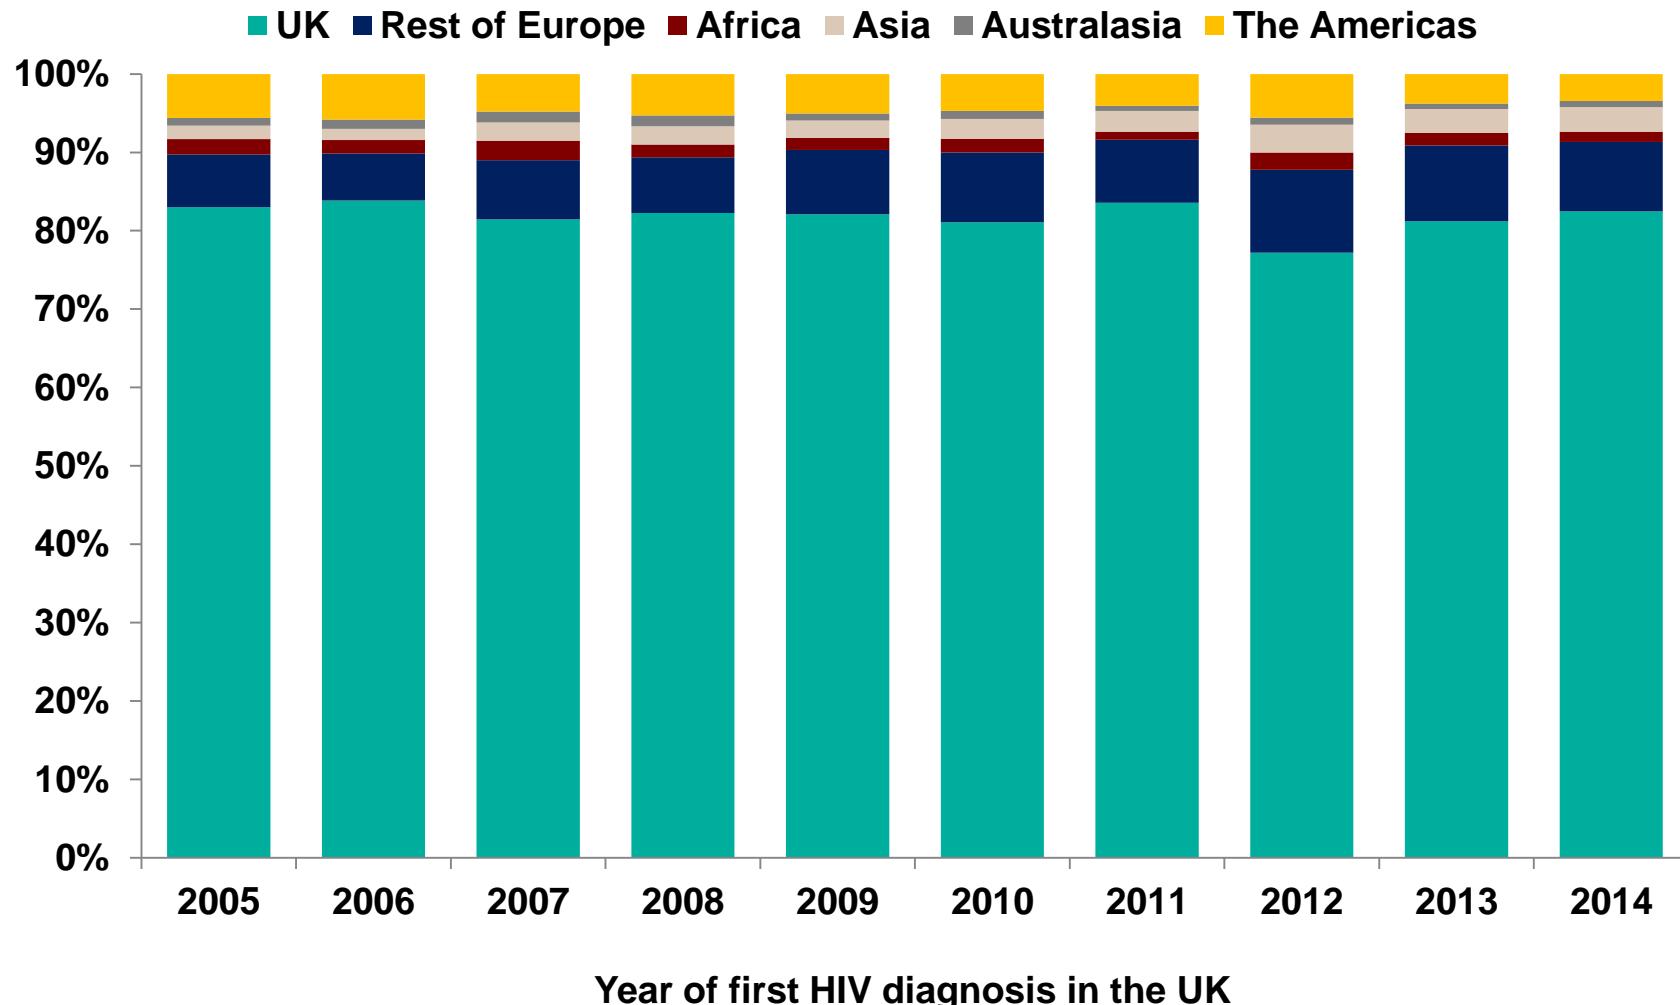

# Number of people newly diagnosed with HIV by exposure group: United Kingdom, 2005-2014

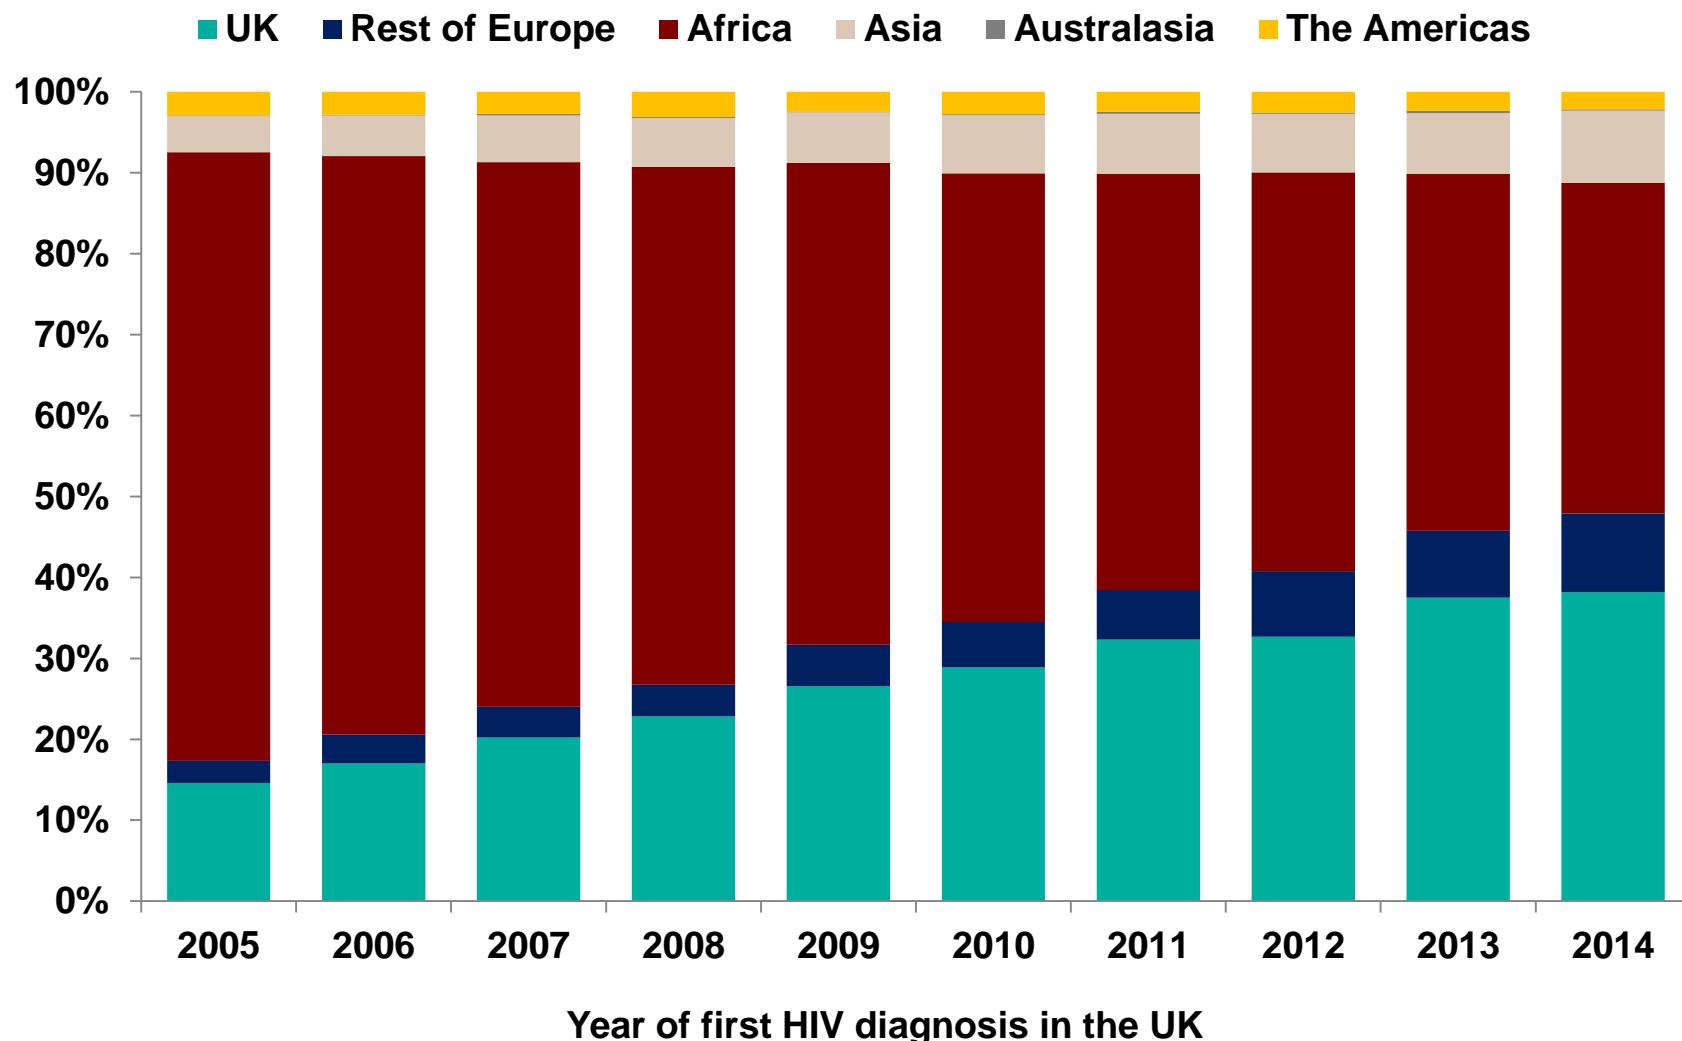

# Proportion of men who have sex with men newly diagnosed with HIV by probable world region where HIV was acquired: United Kingdom, 2005-2014

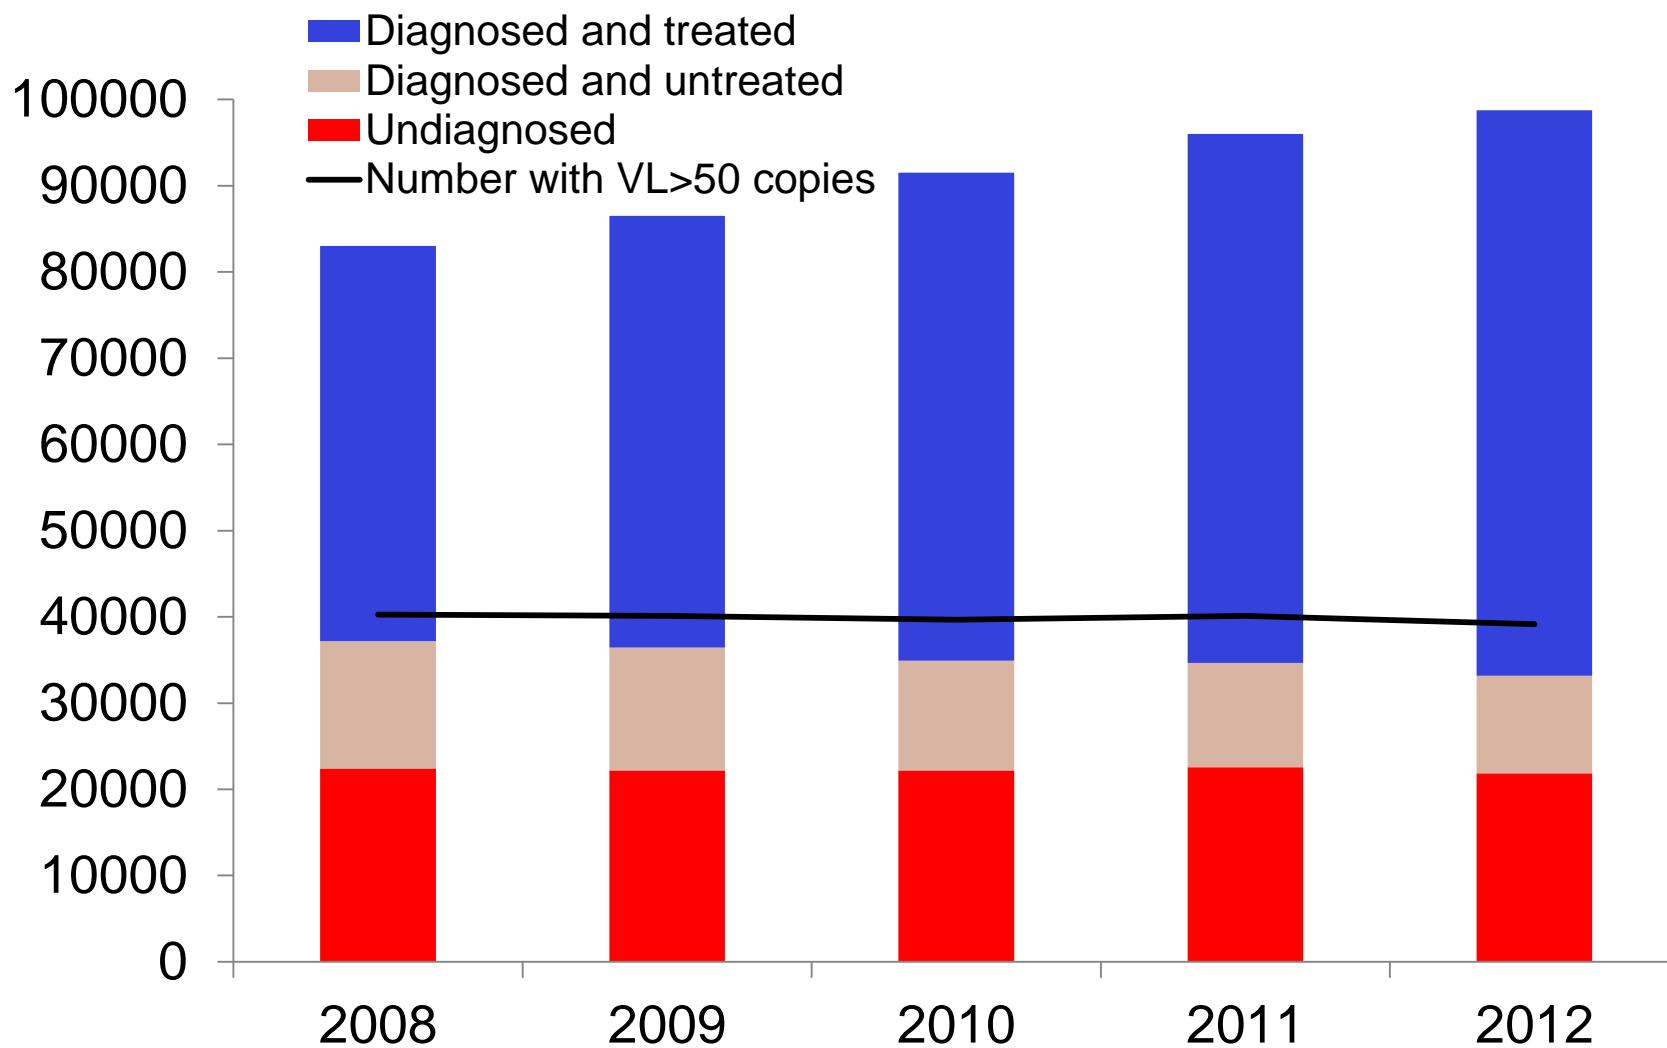

# Proportion of heterosexual men and women newly diagnosed with HIV by probable world region where HIV was acquired: United Kingdom, 2005-2014

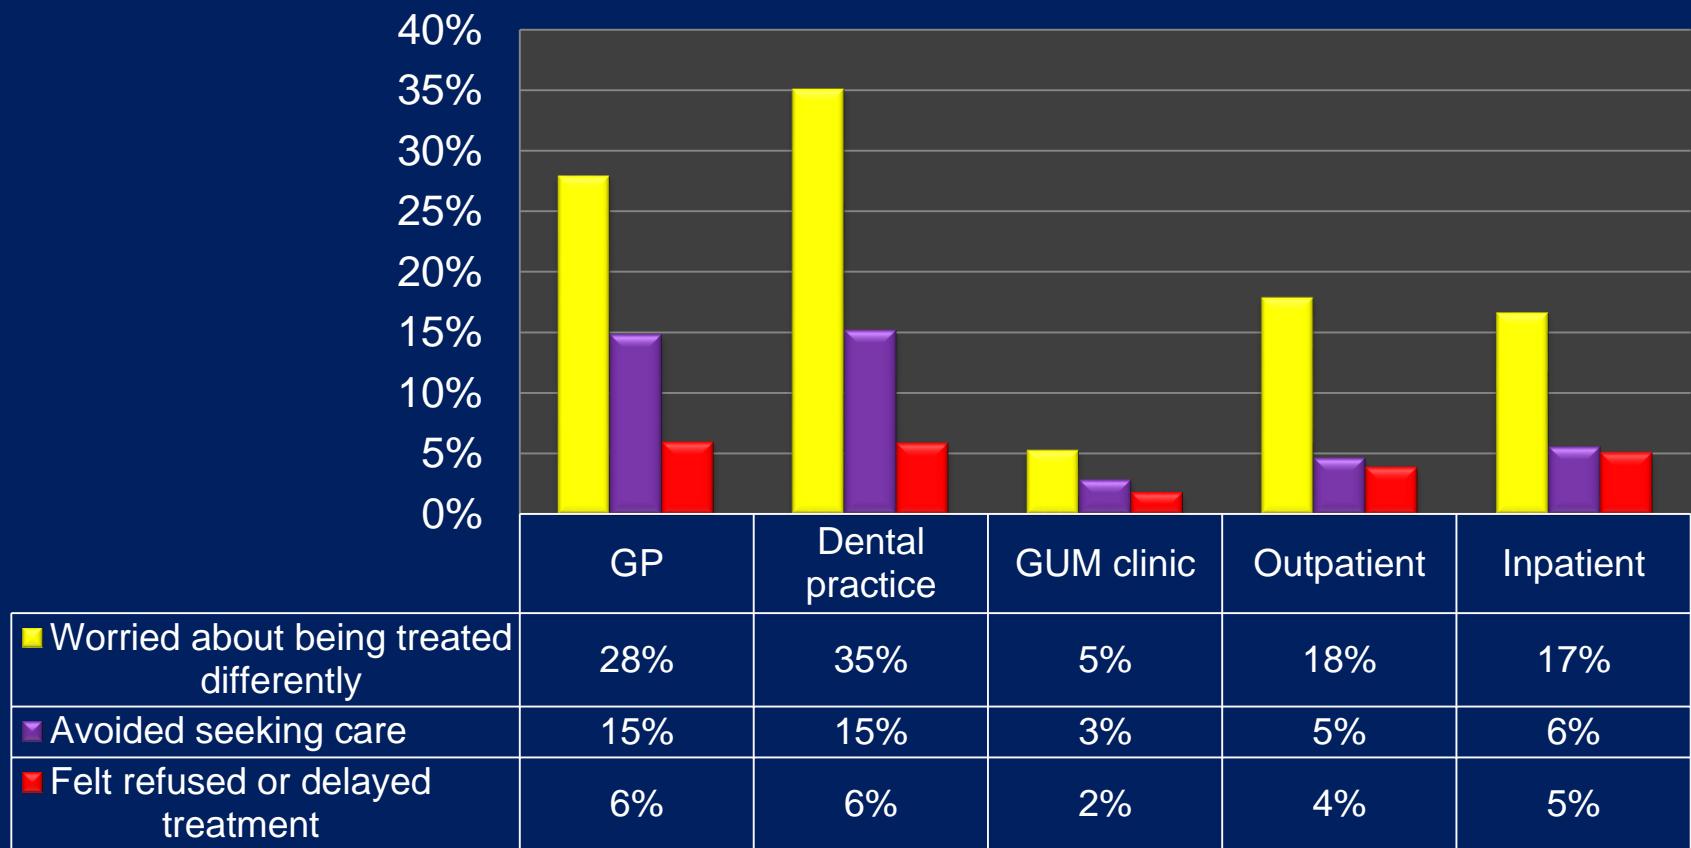

# People living with HIV by diagnostic and treatment status, and number with detectable viral load, UK, 2006-2012

# The People Living with HIV Stigma Survey 2015

## Anticipated and experienced stigma in the last 12 months (N=1576)

# Conclusions

- The Clinical outcomes of people living with HIV accessing their care through the National Health Service (NHS) are excellent and improving.
- In 2014 the population as a whole and subgroups of people living with HIV in the UK has reached the UNAIDS targets of
  - 90% diagnosed on ART and
  - 90% virally suppression for those on ART
- Some minor differences by demographics and exposure groups exist however, with a need to increase undetectability among young people.
- Clinical care indicators improved over the past 5 years. This is due to
  - Earlier prescribing and uptake of ART as per British HIV Association guidelines and
  - An 'artificial' improvement due to an 'open cohort' effect
- People unaware of their infection remains high and we need to beware of an artificial % drop as more people are diagnosed with HIV.
